

ethereum
vienna

General Introduction

Project

Decentralisation of the web

Removing the role of central points

Takes away control from service owners

Data cannot just disappear

Data can only be modified by certain rules*

Censorship resistant

Server cannot freeze funds

* most of the time

Web 3.0

Platform for decentralised applications (**DApps**)

Ethereum (Blockchain)

Consensus Layer

Whisper

Messaging and Broadcasting

Swarm / IPFS (Content System)

Data publication and distribution

DApps

Escrow Standard UI Wallet

Crowdfunding Weifund

Subscription Services (see workshop)

Prediction Markets Augur / Gnosis

Registries Namereg

Marketplace Safemarket

Decentralised Autonomous Organisations (DAO)

Stablecoins MakerDAO

Blockchain

Public record of all transactions

Stored and processed by all full nodes

Determines order of transactions

Necessary to determine current state of the system

Blockchain

Account based System

identified by a 160 bit address

has a balance of Ether / Wei

2 types of accounts

External / Account

Internal / Contract

Blockchain

Account (external)

user controlled account

controlled by a private key

can send and receiver ether

0x1350cf34d093953ce0d2803648da8f3b6a84de77	100
0xd5f9d8d94886e70b06e474c3fb14fd43e2f23970	2500
0xd2963cd505c94dbf3bc663bdd2321bd3000204bb	23290
0xd2963cd505c94dbf3bc663bdd2321bd3000204bb	123809
...	...

Blockchain

Contract (internal)

Controlled by code (evm byte-code)

Gets executed whenever something is sent to it

Ether can only be sent out by the code

Persistent 256 bit to 256 bit storage

Can send messages to other contracts

```
DUP2 SWAP1 SSTORE POP DUP5 DUP5 POP PUSH1 0x6 ADD
PUSH1 0x0 SWAP1 SLOAD SWAP1 PUSH2 0x1 0x0 EXP
SWAP1 DIV PUSH1 0xff AND PUSH2 0x6 0x88 JUMPI DUP5
DUP5 POP PUSH1 0x1 ADD PUSH1 0x0 POP SLOAD DUP4 LT
ISZERO PUSH2 0x5 0x8e JUMPI PUSH2 0x6 0x83 JUMP
JUMPDEST DUP5 DUP5 POP PUSH1 0x0 ADD PUSH1 0x0
```

Blockchain

Code written in an ethereum specific language

- Solidity

high level

official language

- LLVM

lisp-like (low level)

- EVM Assembly

```
contract Coin {  
  
    event Transfer(address indexed from, address indexed to);  
  
    mapping (address => uint) public balances;  
  
    function() {  
        balances[msg.sender] = 10;  
    }  
  
    function Send(address to, uint amount) {  
        if(balances[msg.sender] >= amount) {  
            balances[msg.sender] -= amount;  
            balances[to] += amount;  
        }  
    }  
}
```

Blockchain

Message

1 Sender

1 Recipient

Value in Ether / Wei

Can have additional data

Can have return value

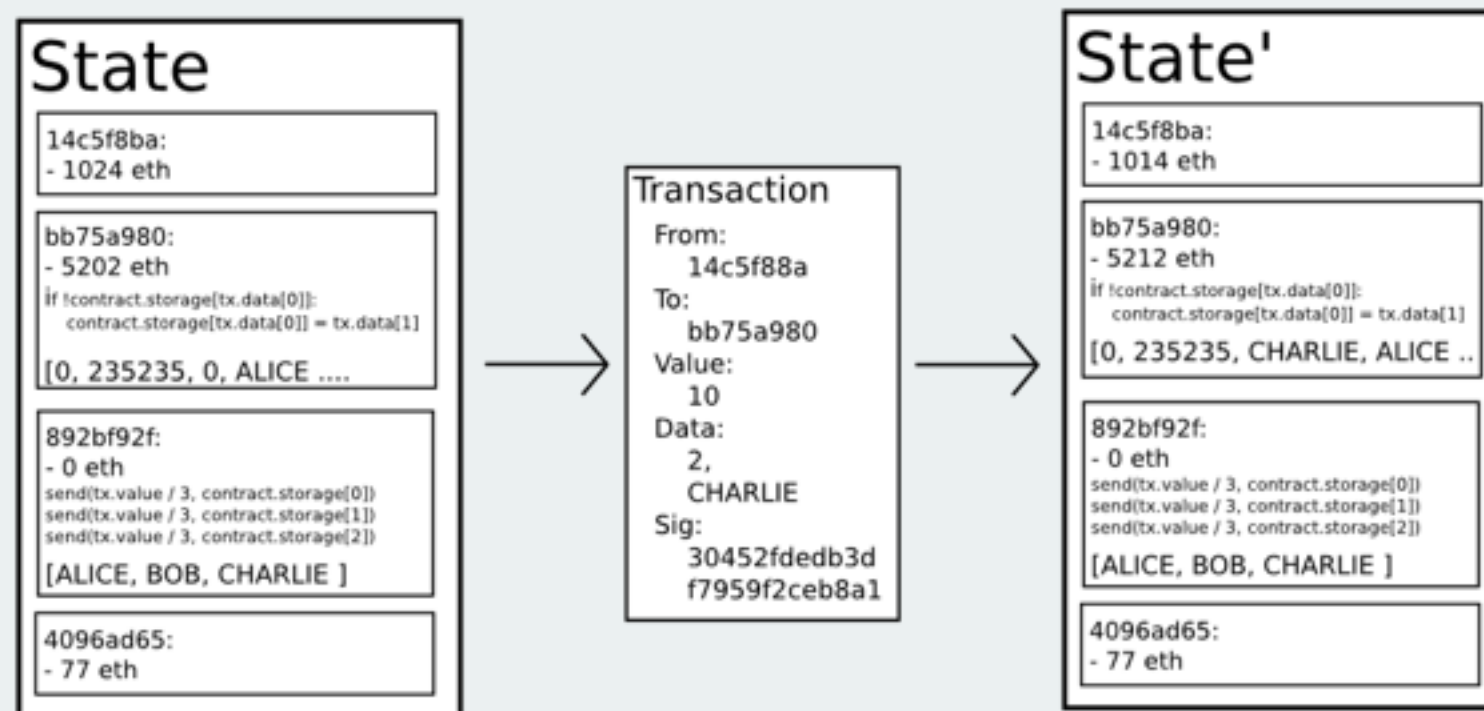

Blockchain

Transaction

Contains a message

Signed by a private key (external account)

Transitions from one state to the next

Blockchain

Gas

Used for transaction fees

Sender “buys” gas at a sender-specified **gasprice**

Every computational step has a fixed gas cost

Remaining gas sent back to sender

If gas runs out

- the state reverts

- but miner keeps ether

Blockchain

Gasprice

Associated gas cost for some action is constant

But the price of ether is not

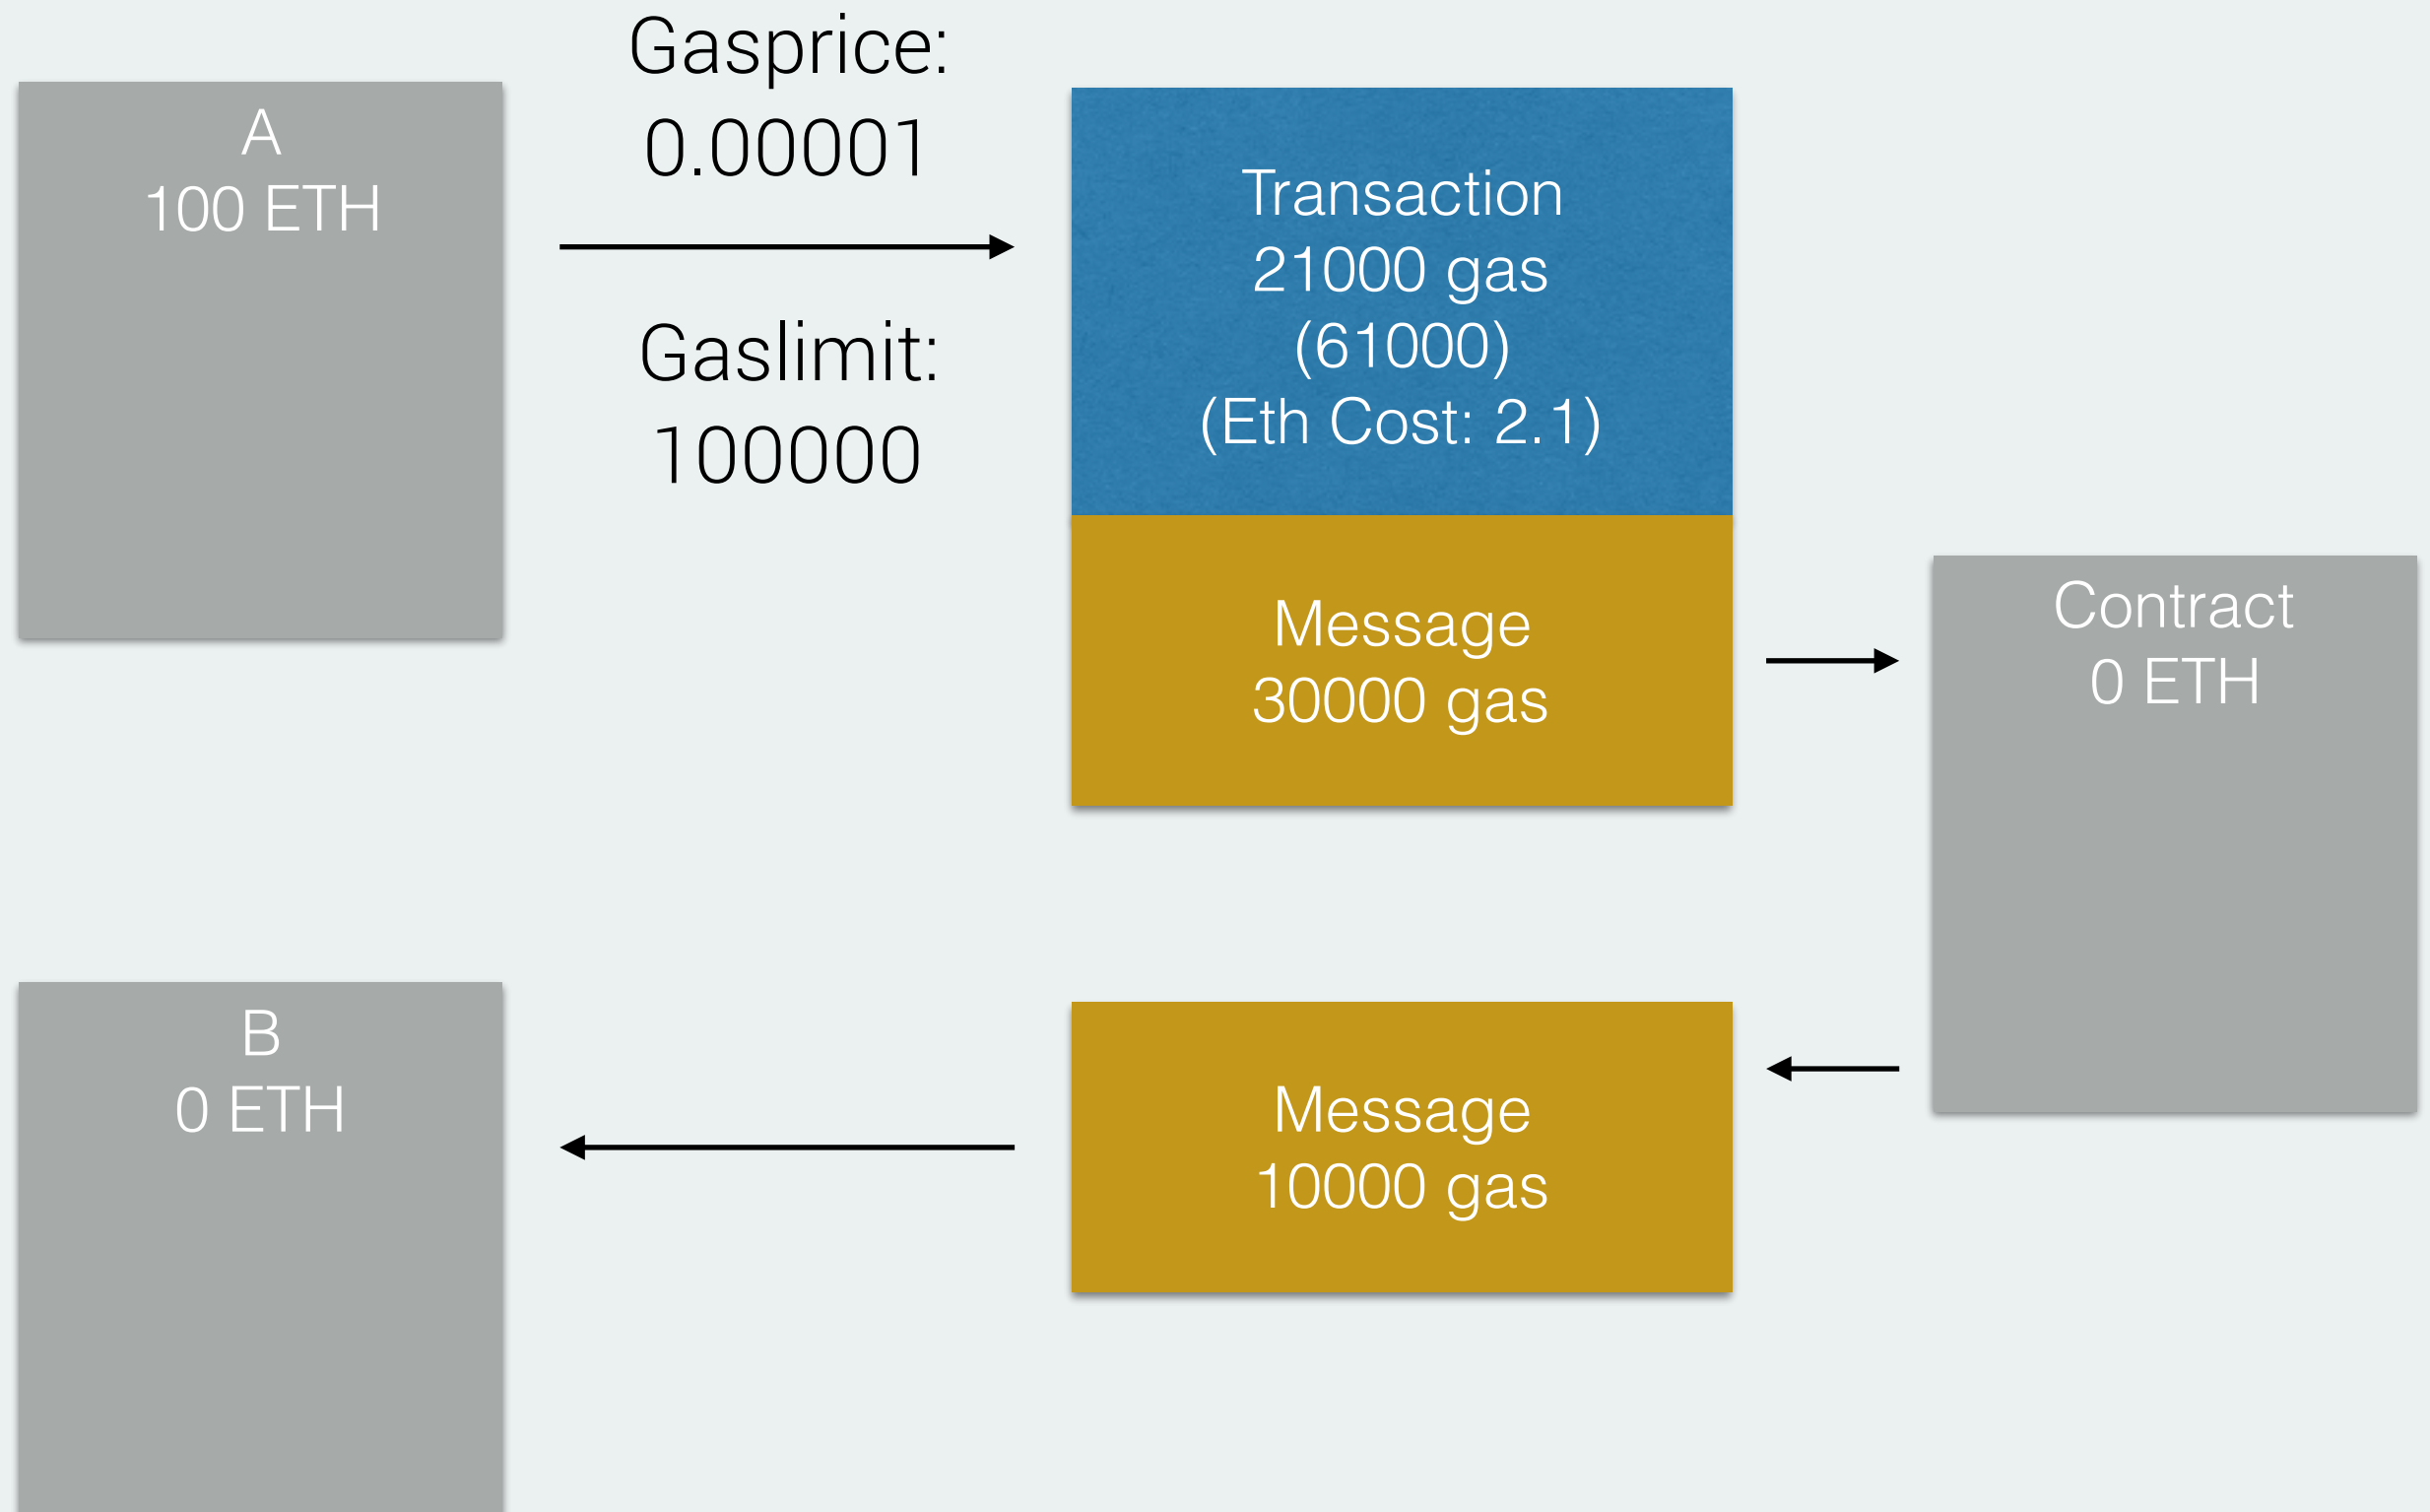

Gasprice is a scale factor against ether price

Ether goes up -> Gasprice goes down

Ether goes down -> Gasprice goes up

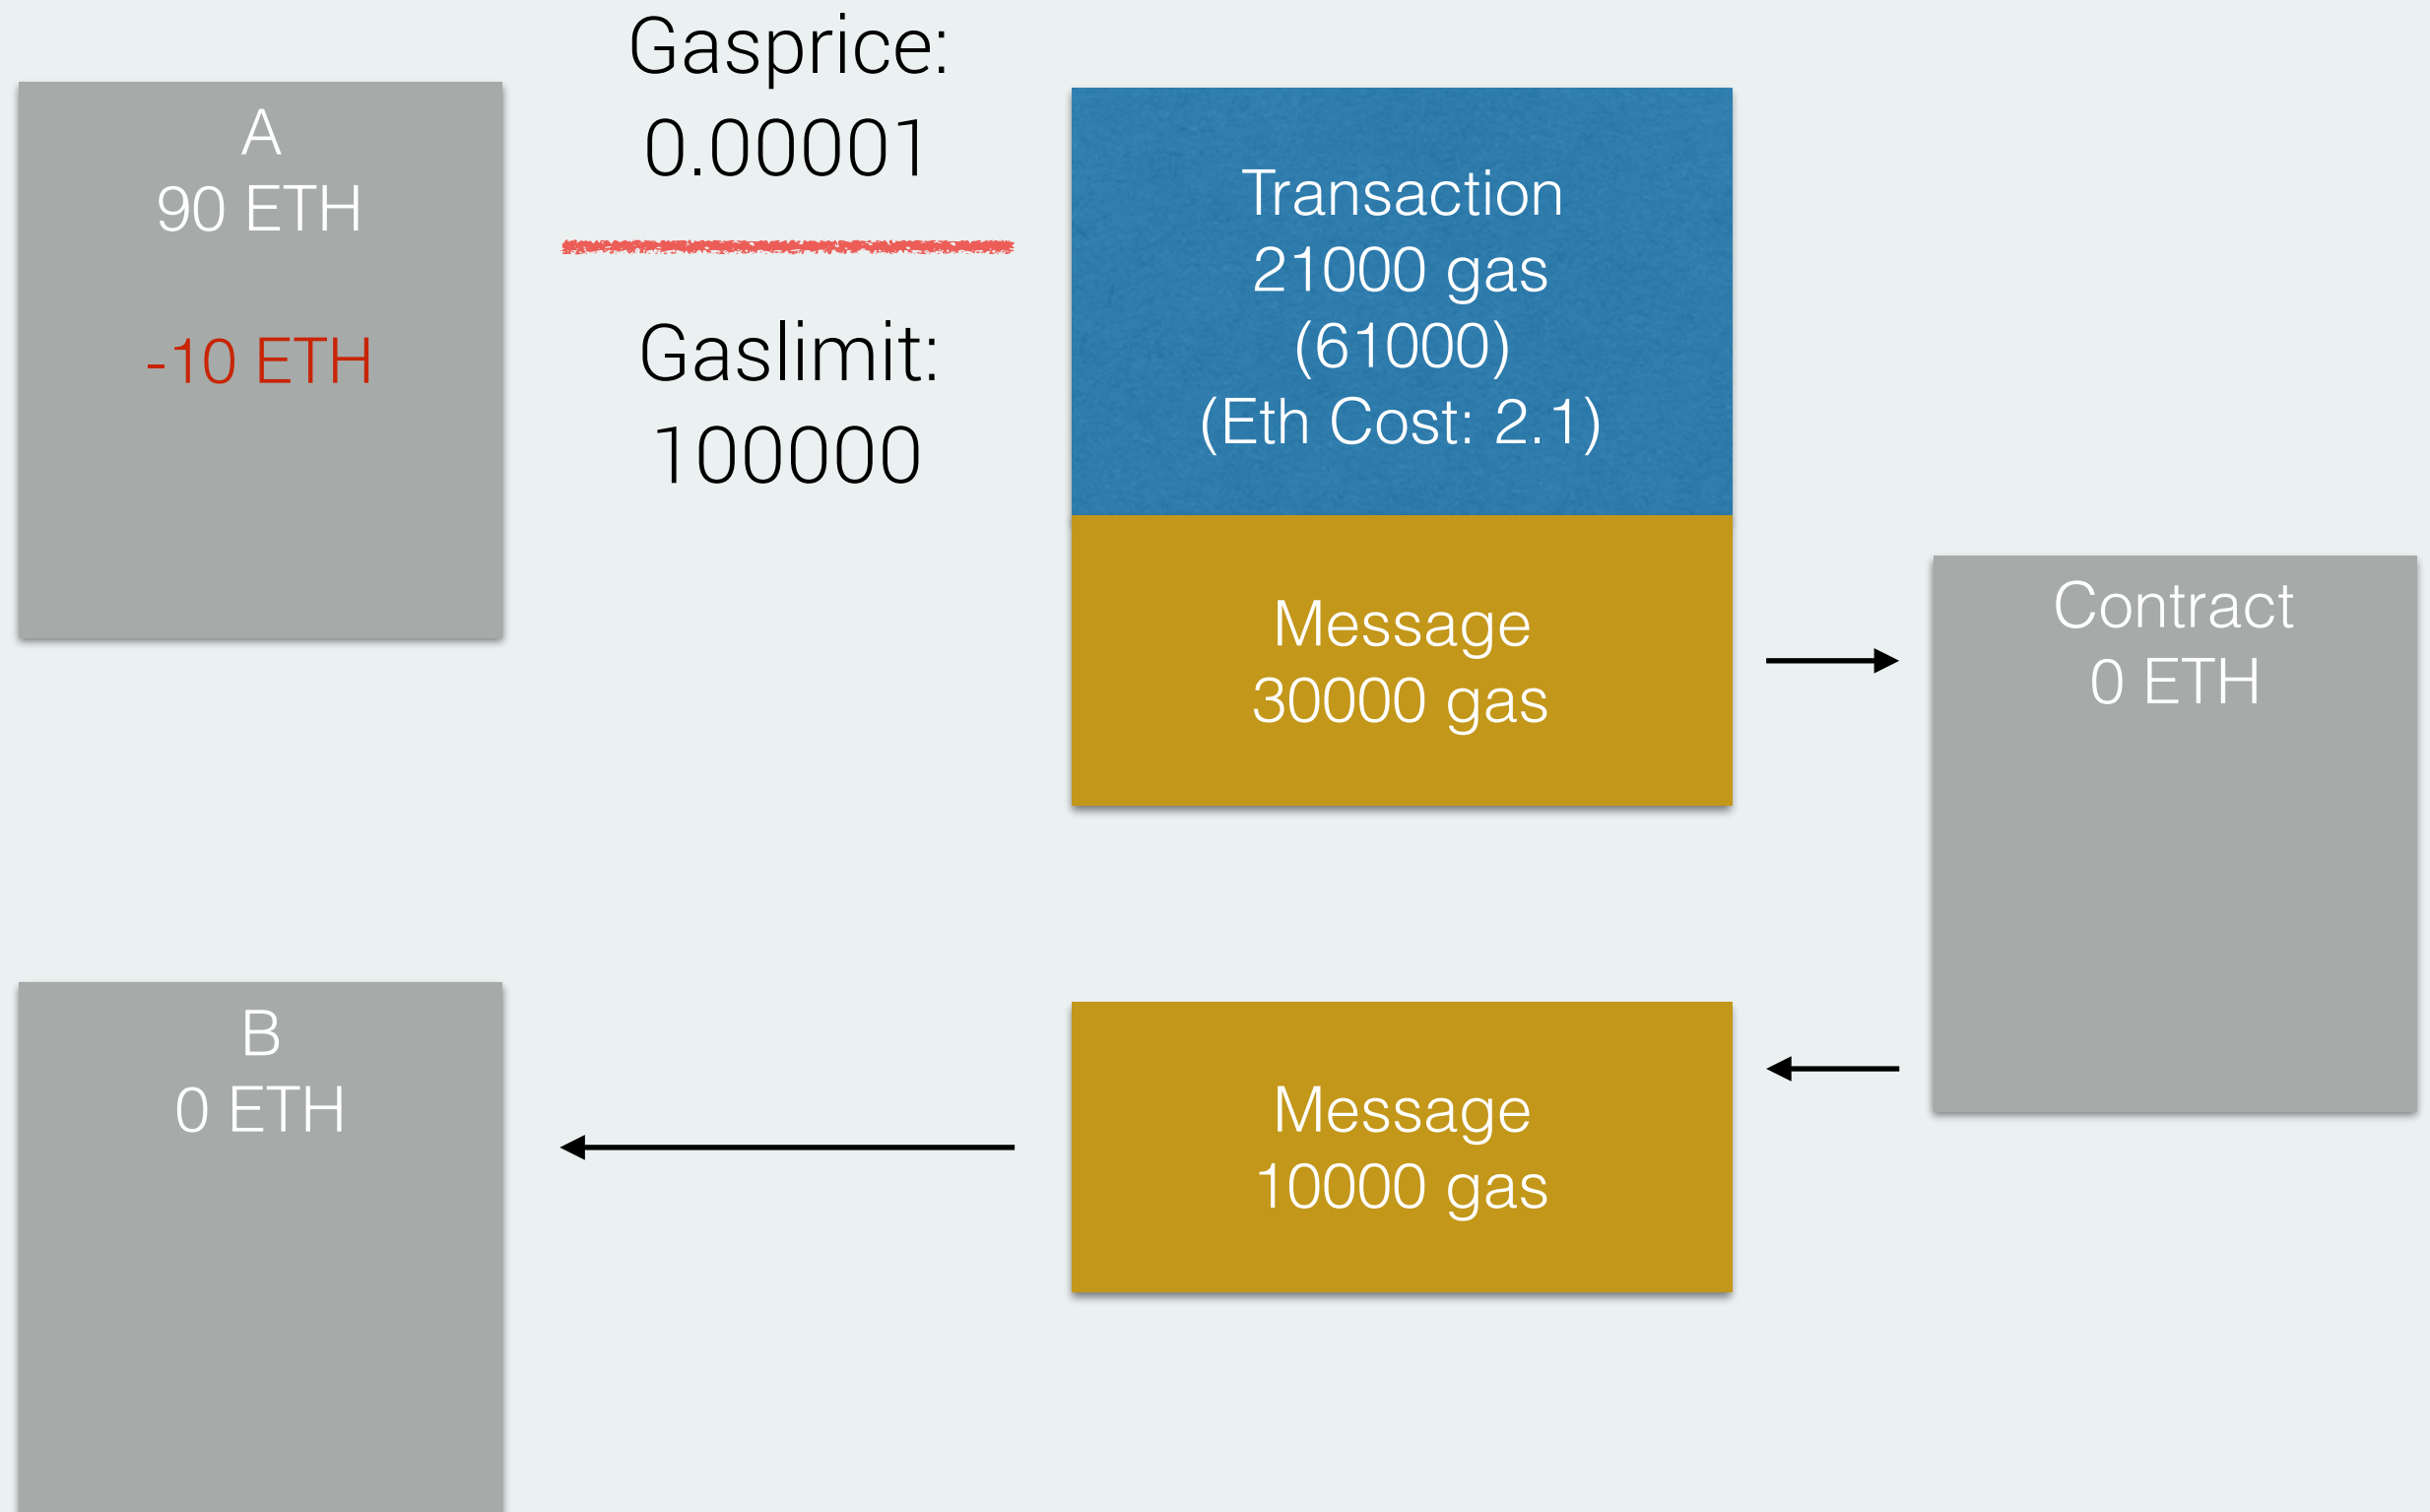

Blockchain

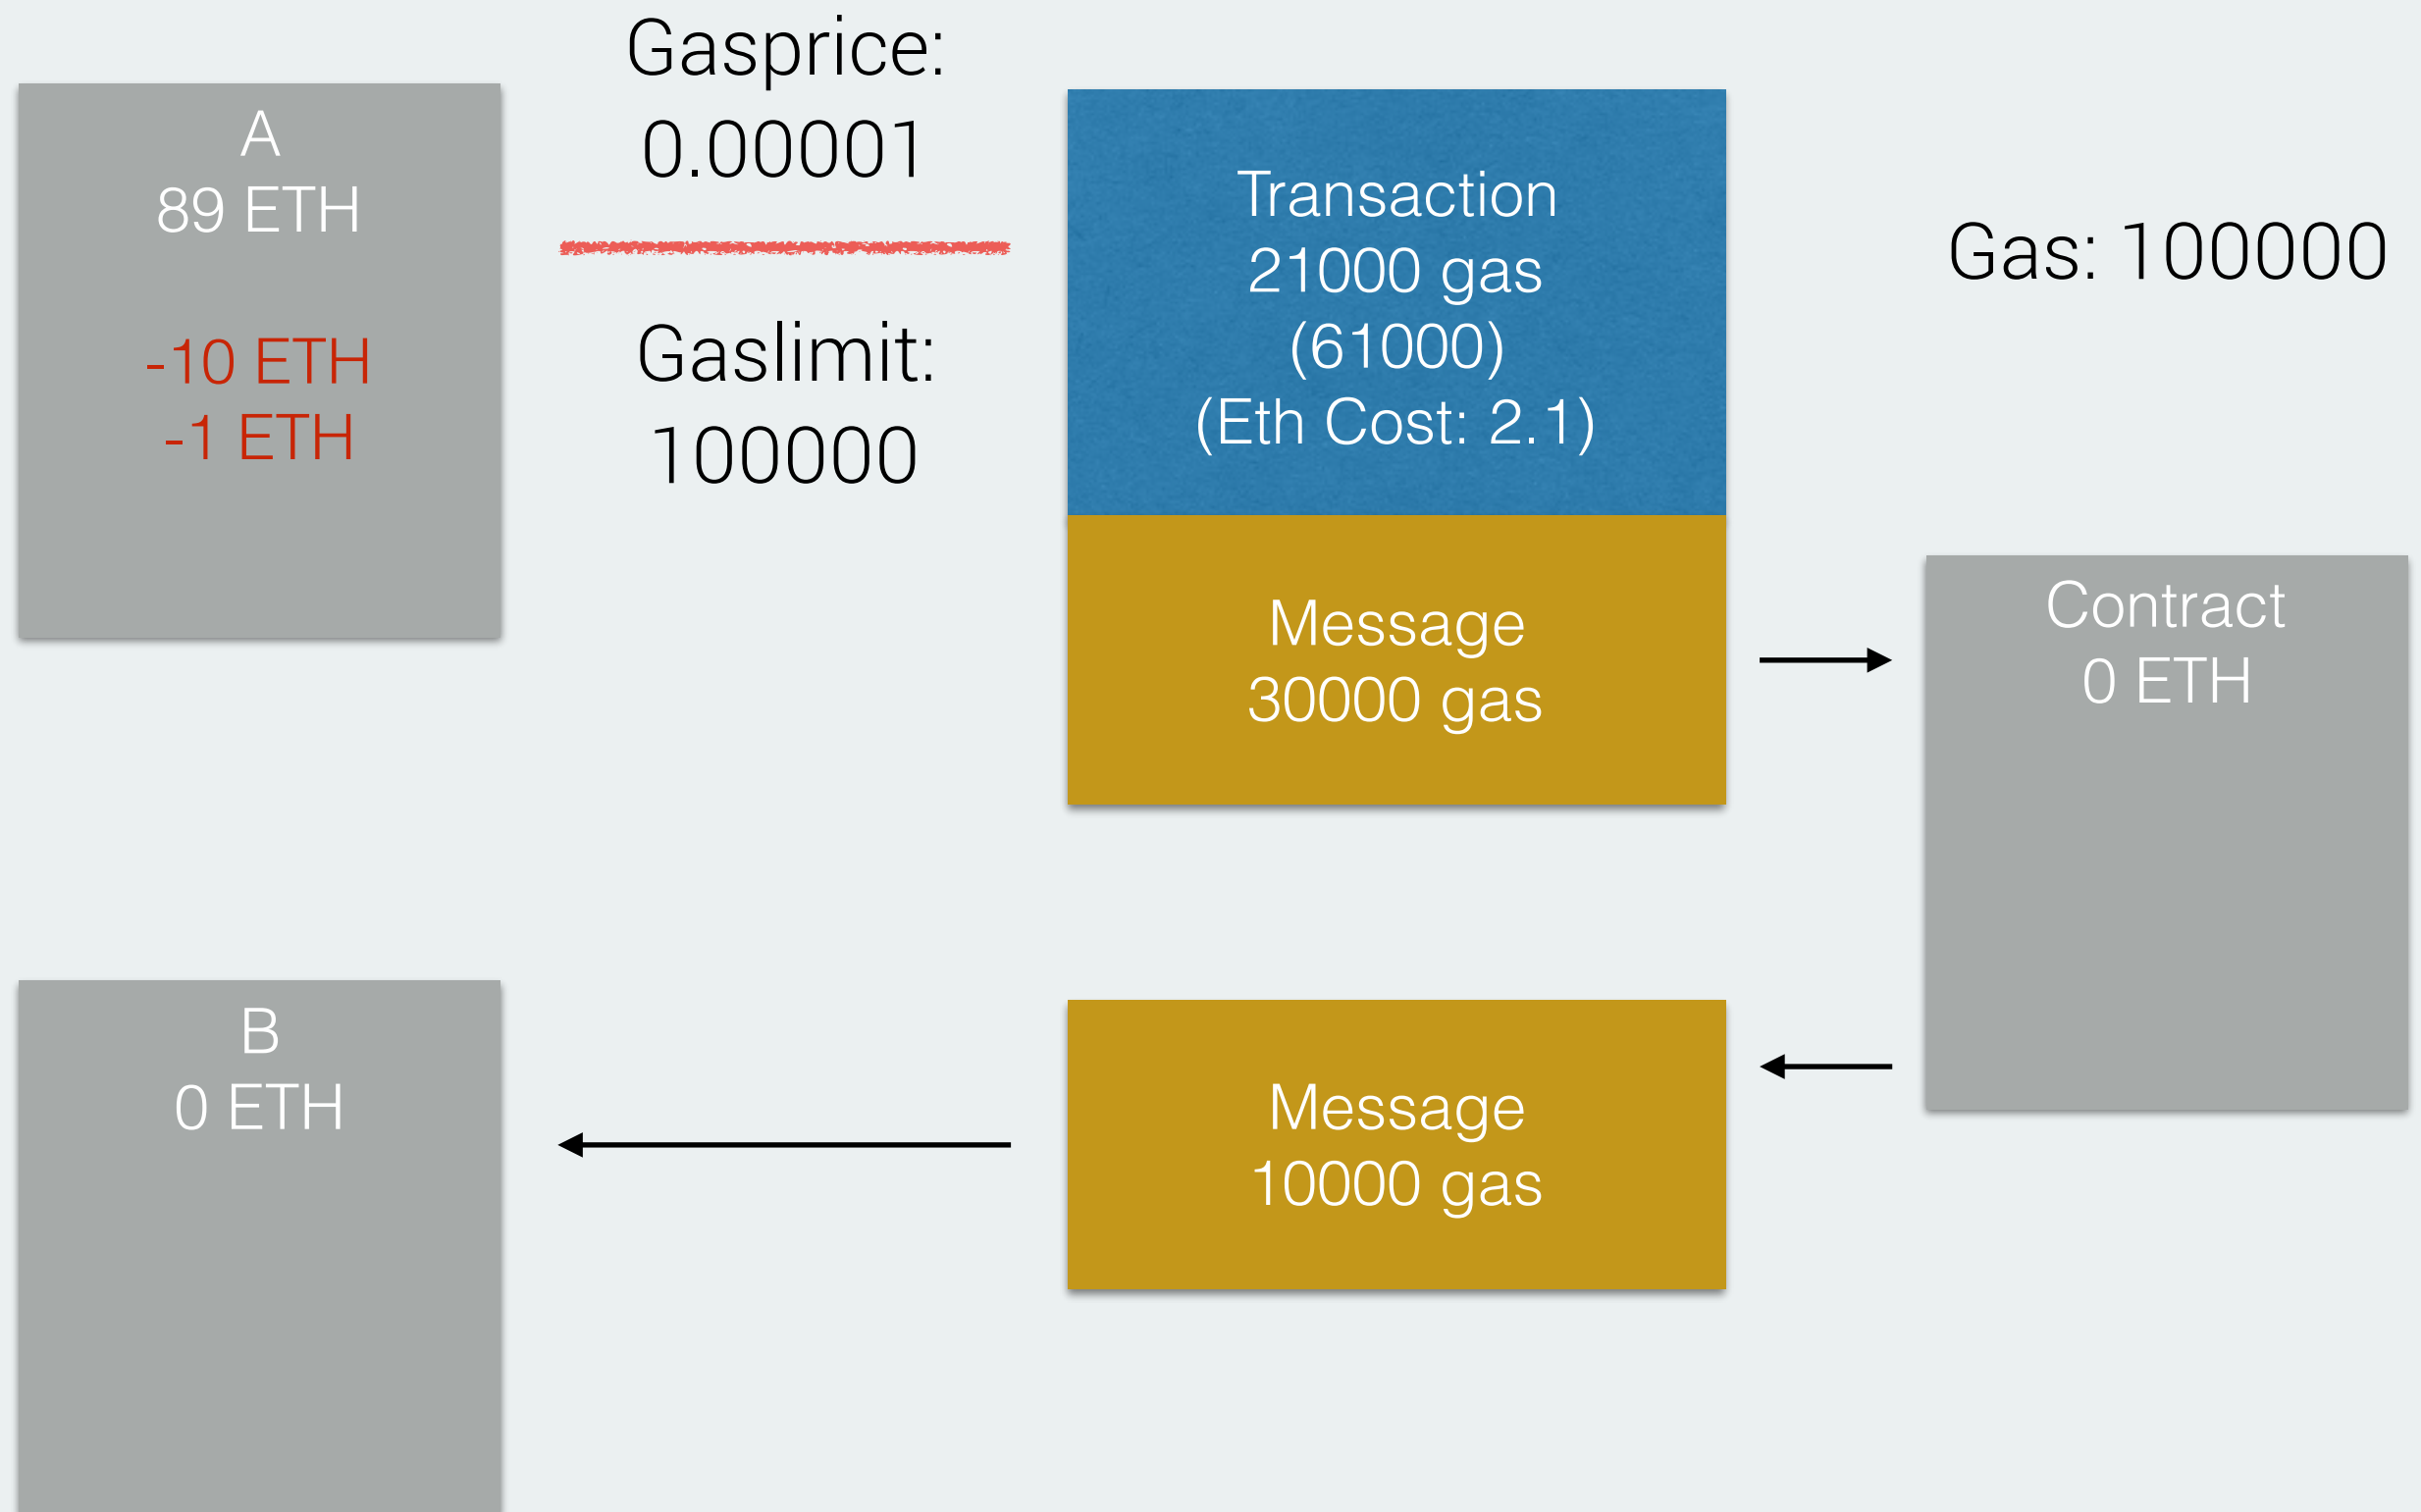

Blockchain

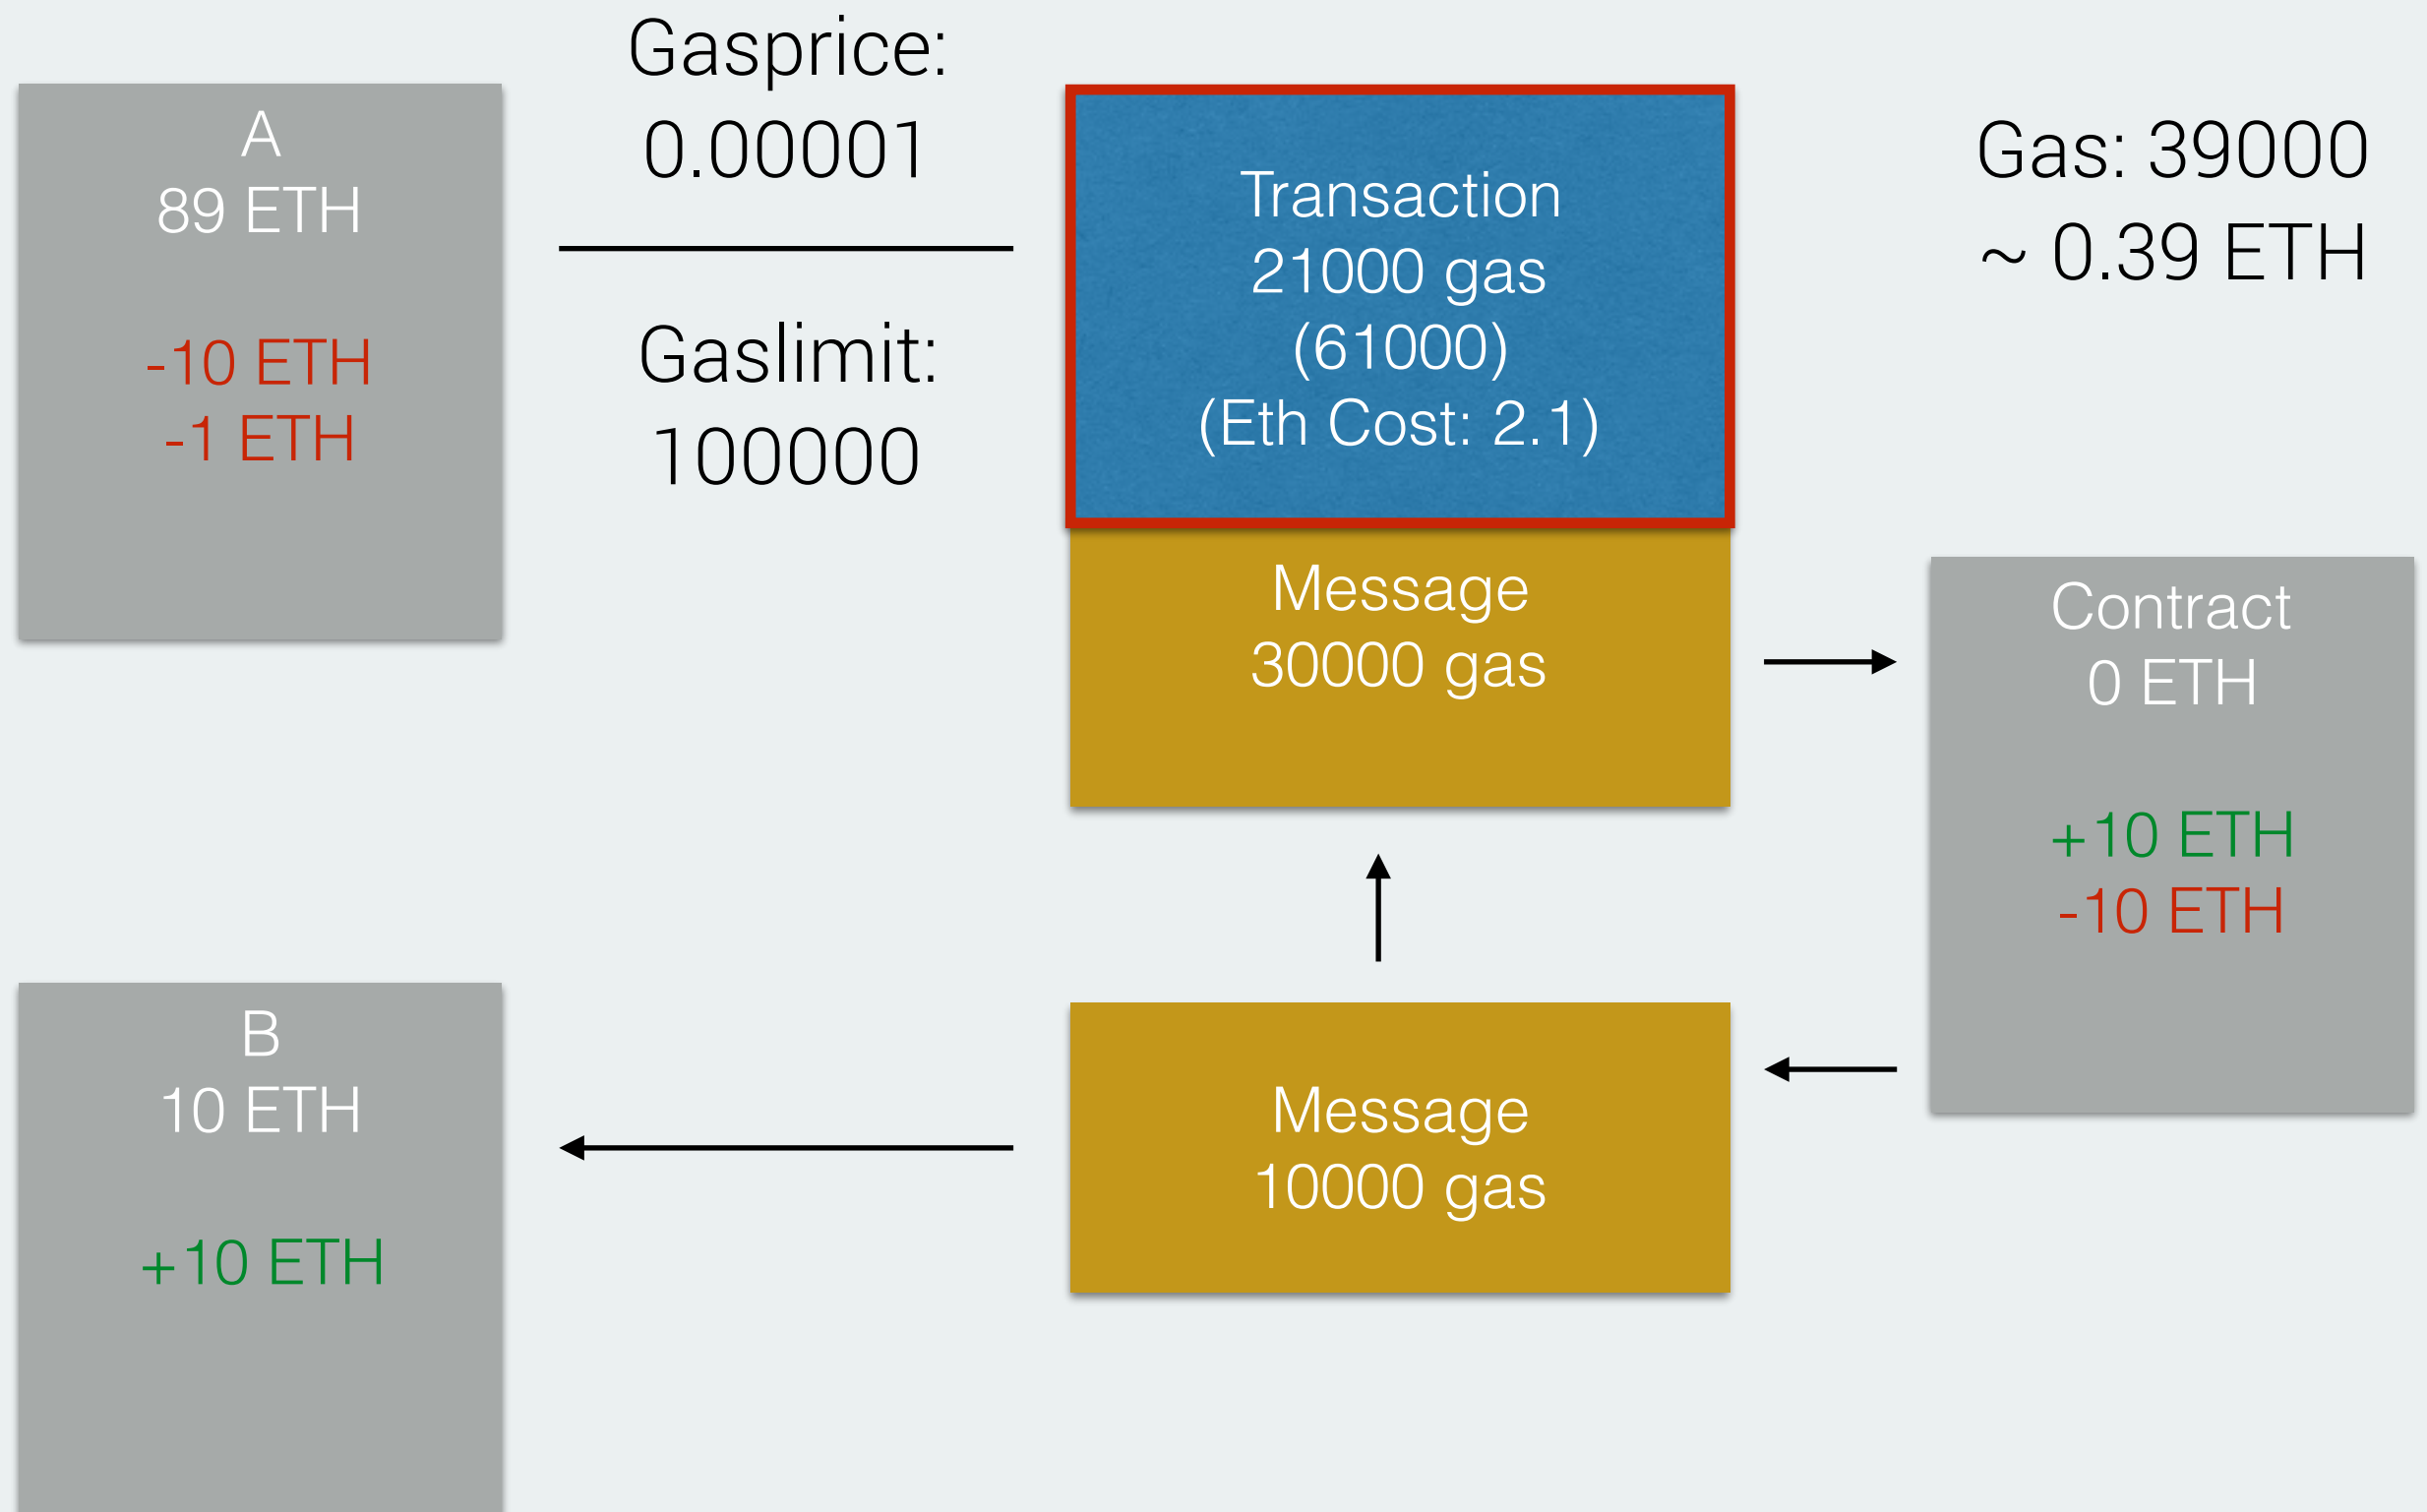

Blockchain

Blockchain

Blockchain

Blockchain

Blockchain gives transactions an order

Transactions are grouped together into blocks

Order is important:

Double spend (no unspent outputs, but balance might become 0)

2 transactions interacting with the same contract

Different order -> Potential different outcome

Blockchain

Blocks form a chain

~15 seconds apart

Some can uncle blocks

Longest chain is considered the consensus

Blockchain

Proof of Work (Ethereum 1.0)

EthHash

asic-resistant (high memory, io bandwidth)

targets gpu mining (2GB+ GRAM)

To be succeeded by Casper (PoS)

Exponential difficulty increase -> Freeze in December

Constant Block Reward during PoW Phase

Blockchain

Yellow Paper (github: ethereum/latexpaper)

ETHEREUM: A SECURE DECENTRALISED GENERALISED TRANSACTION LEDGER HOMESTEAD DRAFT

0xf1 CALL

7 1

Message-call into an account.

$$\mathbf{i} \equiv \mu_{\mathbf{m}}[\mu_{\mathbf{s}}[3] \dots (\mu_{\mathbf{s}}[3] + \mu_{\mathbf{s}}[4] - 1)]$$

$$(\sigma', g', A^+, \mathbf{o}) \equiv \begin{cases} \Theta(\sigma, I_a, I_o, t, t, & \text{if } \mu_{\mathbf{s}}[2] \leq \sigma[I_a]_b \wedge \\ C_{\text{CALLGAS}}(\mu), I_p, \mu_{\mathbf{s}}[2], \mu_{\mathbf{s}}[2], \mathbf{i}, I_e + 1) & I_e < 1024 \\ (\sigma, g, \emptyset, \mathbf{o}) & \text{otherwise} \end{cases}$$

$$n \equiv \min(\{\mu_{\mathbf{s}}[6], |\mathbf{o}|\})$$

$$\mu'_{\mathbf{m}}[\mu_{\mathbf{s}}[5] \dots (\mu_{\mathbf{s}}[5] + n - 1)] = \mathbf{o}[0 \dots (n - 1)]$$

$$\mu'_g \equiv \mu_g + g'$$

$$\mu'_{\mathbf{s}}[0] \equiv x$$

$$A' \equiv A \uplus A^+$$

$$t \equiv \mu_{\mathbf{s}}[1] \bmod 2^{160}$$

where $x = 0$ if the code execution for this operation failed due to an exceptional halting

$Z(\sigma, \mu, I) = \top$ or if

$\mu_{\mathbf{s}}[2] > \sigma[I_a]_b$ (not enough funds) or $I_e = 1024$ (call depth limit reached); $x = 1$ otherwise.

$$\mu'_i \equiv M(M(\mu_i, \mu_{\mathbf{s}}[3], \mu_{\mathbf{s}}[4]), \mu_{\mathbf{s}}[5], \mu_{\mathbf{s}}[6])$$

Thus the operand order is: gas, to, value, in offset, in size, out offset, out size.

Whisper

Decentralised Messaging

Messages can be filtered by topics

Very flexible

- Messages can be encrypted

- Messages can be signed

- Broadcast

PoW for spam protection and priority

Not designed for real time communication

Swarm

Swarm (Not yet merged, but live network) or IPFS

Reverse Hash-table

Originator of source unknown

Low-latency

Incentivation model for storage

“bzz” branch in go-ethereum repository

Funding

Funded by crowdfunding

31.529 BTC raised (~18.5m USD at the time)

Over 9000 Transactions

half of that value lost due to bitcoin price decline

but rise in ether price secured funding for 4 years

2.0

Abstraction

- Contract pays fee

- Other signing mechanisms

Casper

- Proof of Stake with weak subjectivity

- Prediction market for blocks

Scalability

- Sharding

Release Process
